

INTRAVASCULAR DELIVERY OF MIZORIBINE

ABSTRACT OF THE DISCLOSURE

The present invention provides improved devices and methods for minimizing
5 and/or inhibiting restenosis and hyperplasia after intravascular intervention. In particular, the
present invention provides luminal prostheses which allow for programmed and controlled
mizoribine delivery with increased efficacy to selected locations within a patient's
vasculature to inhibit restenosis. An intraluminal delivery prosthesis may comprise an
expansile structure and means on or within the structure for releasing mizoribine into the
10 body lumen to inhibit smooth muscle cell proliferation.
